

# Important Stuff

Undoing Mistakes:	<p>On an Apple computer, you can undo mistakes by holding the <b>command</b> key and hitting <b>z</b>.</p> <p>On a Windows computer, you can undo mistakes by holding the <b>ctrl key</b> and hitting <b>z</b>.</p> <p><b>HINT:</b> <u>Do not</u> hold the z key down at the same time as ctrl! If you do, you will probably undo ALL of your work!</p>
Moving Around the Image:	<p>Hold space, then move your mouse around to move the image around the screen.</p>
Resetting Zoom:	<p>Click the percentage in the bottom left corner of Gimp (see below),</p>  <p>then set it back to 100% to reset your zoom.</p> <p><b>HINT:</b> You can also use this to zoom out by selecting smaller percentages!</p>

# GIMP Tools

This is the GIMP toolbar. It contains many tools that you can use to edit your images and photographs. This sheet will tell you what some of these tools do.

If you hover your mouse over a tool, it will also tell you what the symbol does. Feel free to experiment!

HINT: If your toolbox does not look the same as ours, you can right click on an icon to replace the tool with another!

This is the eraser tool. It will erase whatever you select with the cursor when you click on the image.

This is the movement tool. It will move the image you select on the screen. If it is moving an image you do not want to move, make sure you select the "move active layer" under the Tool Options tab, and select the image you want to move in the Layers tab.

This is the unified transform tool. It allows you to rotate, move, shear, and change the perspective of an image. It's all click and drag. Try it out!

**Squares:** Let you scale the image.

**Hollow Diamonds:** Let you change perspective on the image

**White Diamonds:** Let you shear the image.

**Moving:** Click INSIDE the image and move the mouse.

**Rotating:** Click OUTSIDE the image and move the mouse.

This is the zoom tool. It will let you zoom in to the section of the image that you select. You can switch between zoom in and zoom out in the tool options.

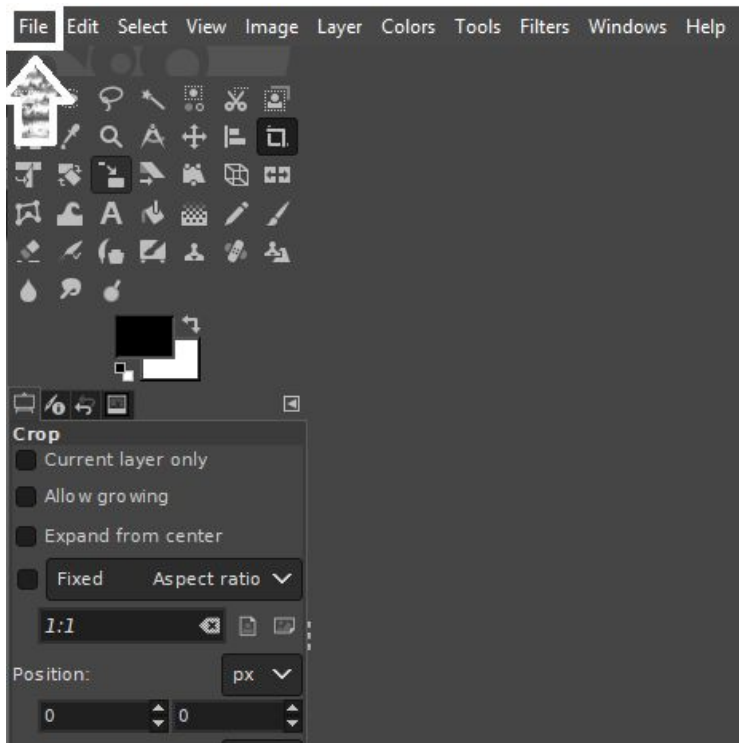

This is the paintbrush tool. They will let you paint on the image currently highlighted under the Layers tab.

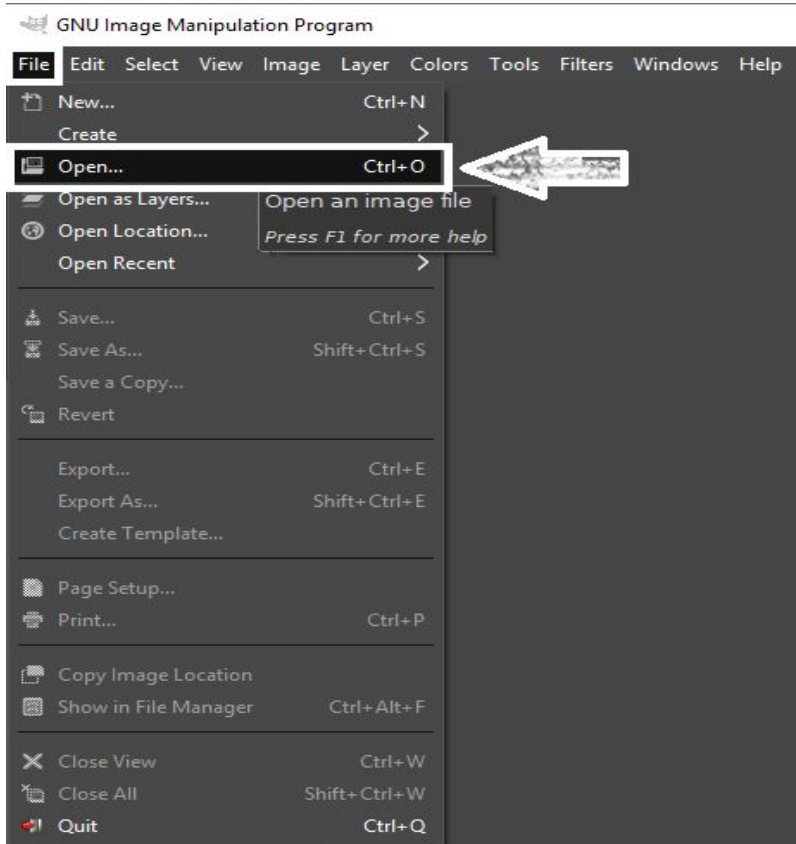

These are selection tools. They will let you select certain parts of an image.

# Opening Files

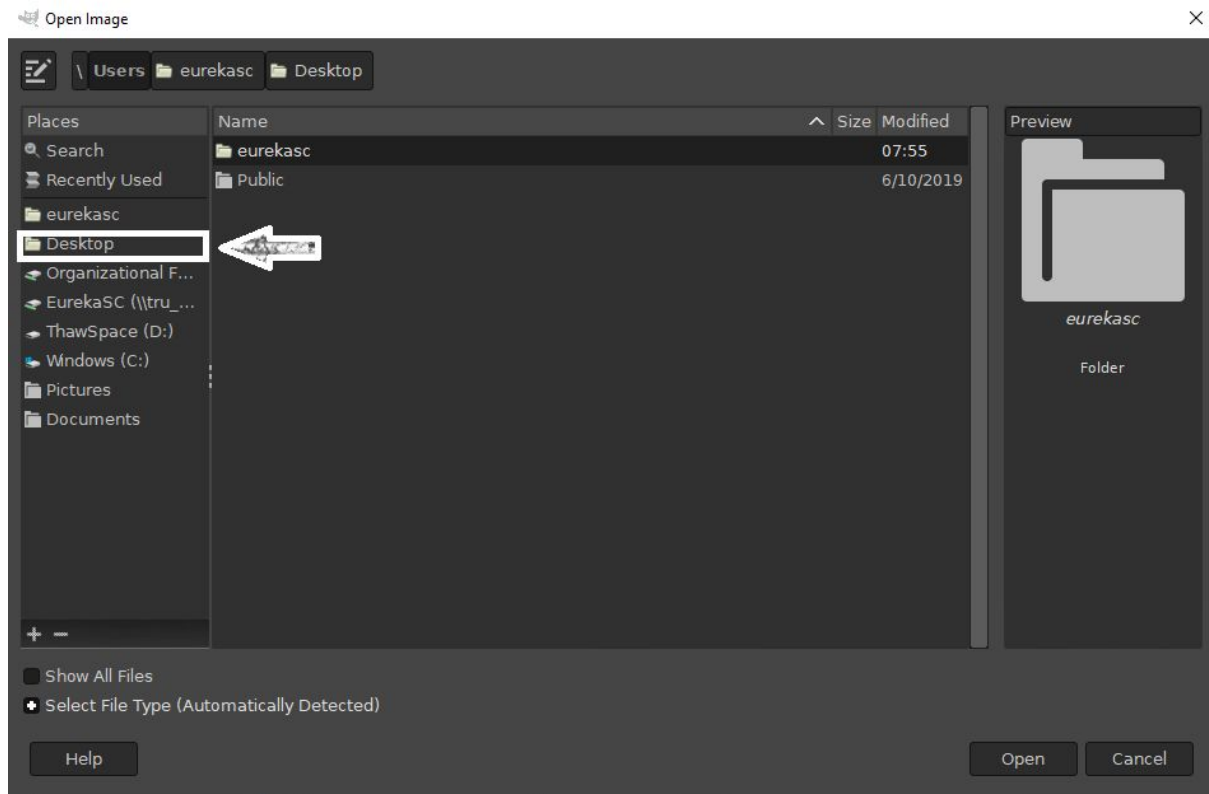

To open a file in GIMP, click “File”:

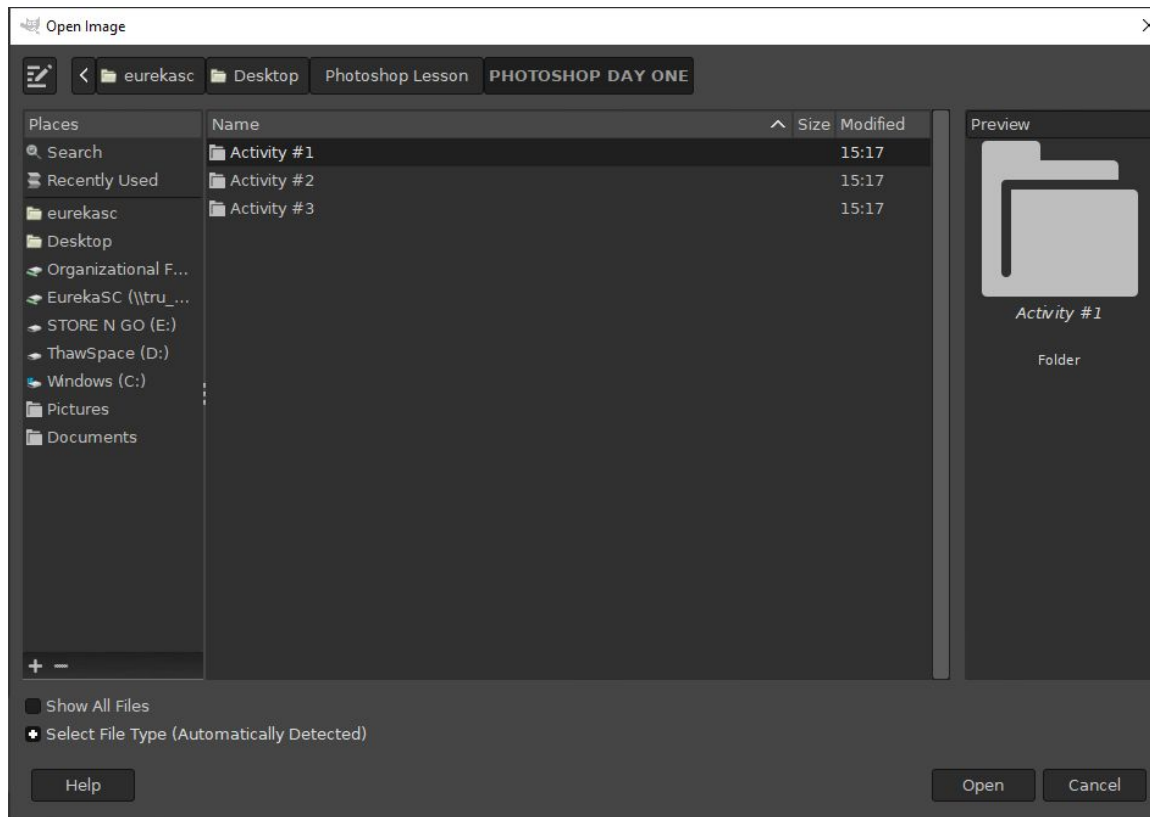

Then click “Open”:

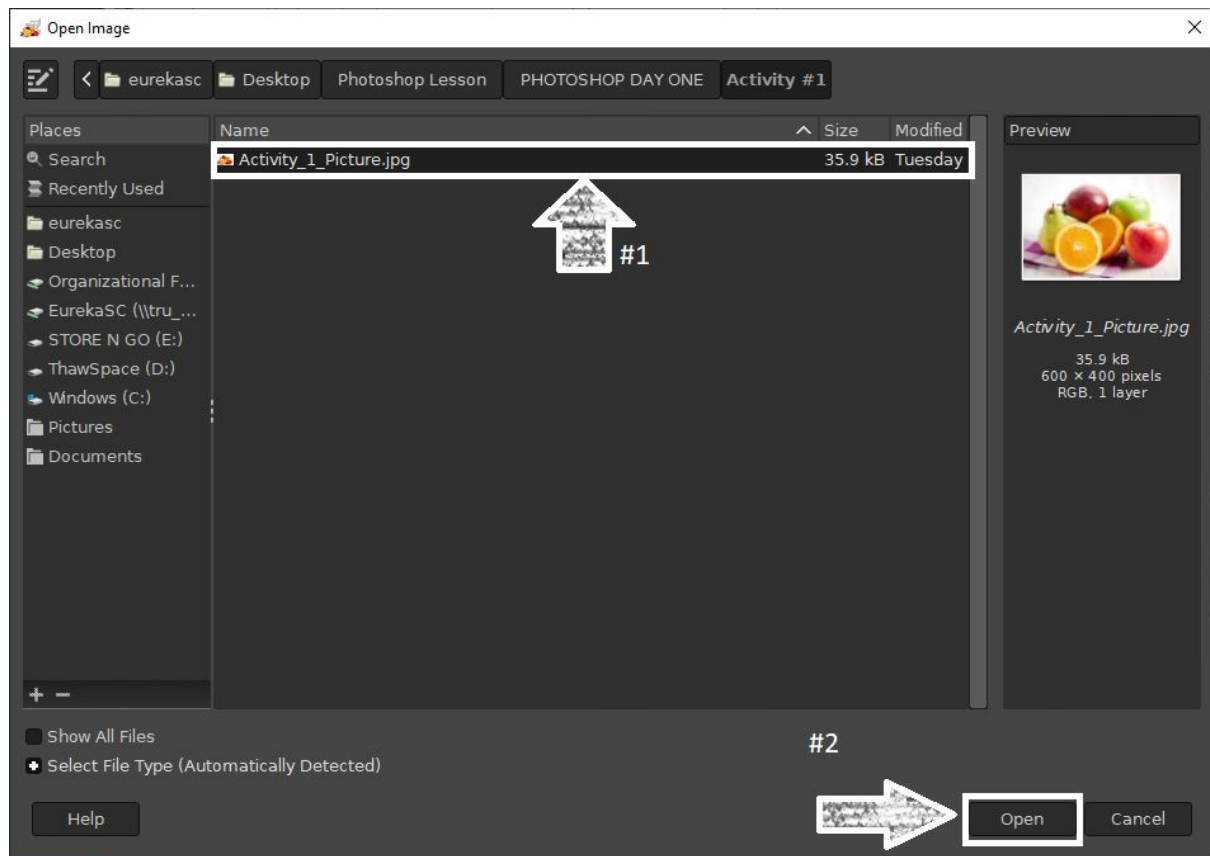

In the new window that pops up, you need to locate where you saved the Photoshop 1 Resources folder:

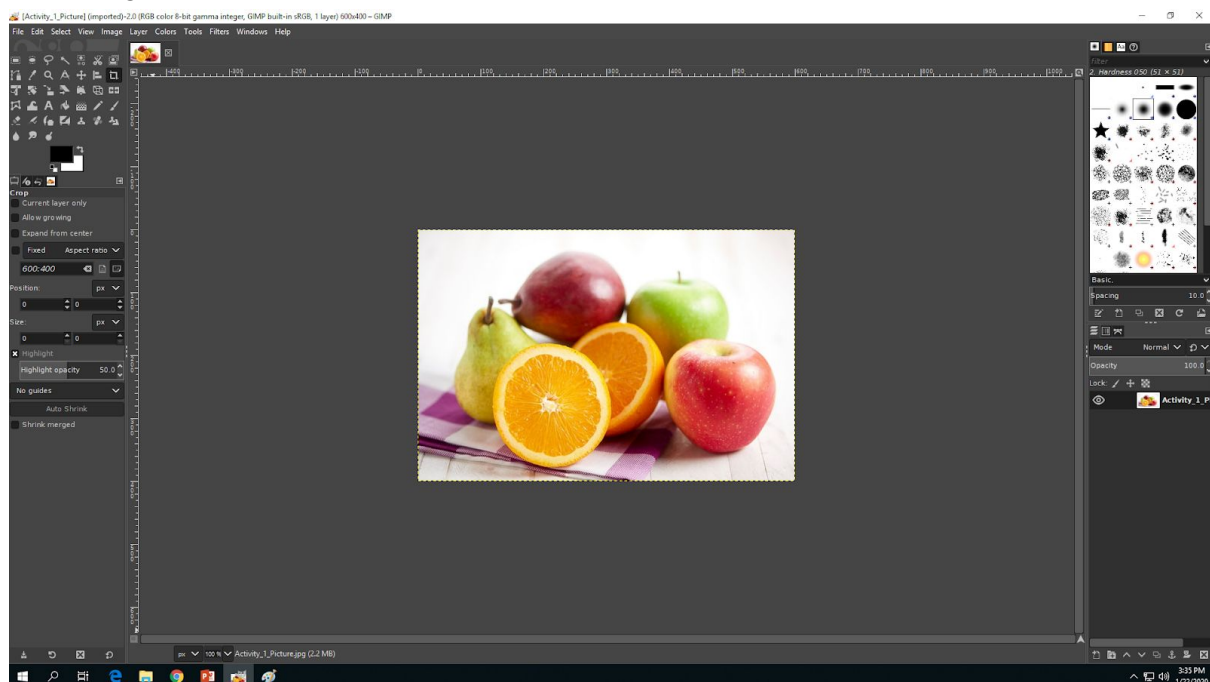

Inside this folder are three folders, sorted by activity. We will tell you which one to open. Open them by double clicking.

Inside the folder will be some images! They will end with either .jpg, .png, or .jpeg. Click on the image you want and then click “Open”.

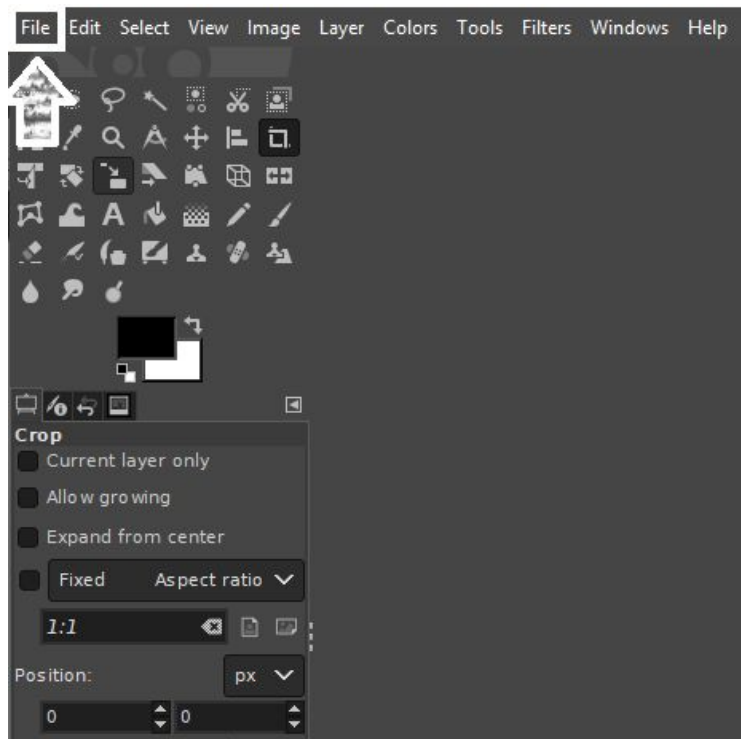

Your image will now appear in GIMP!

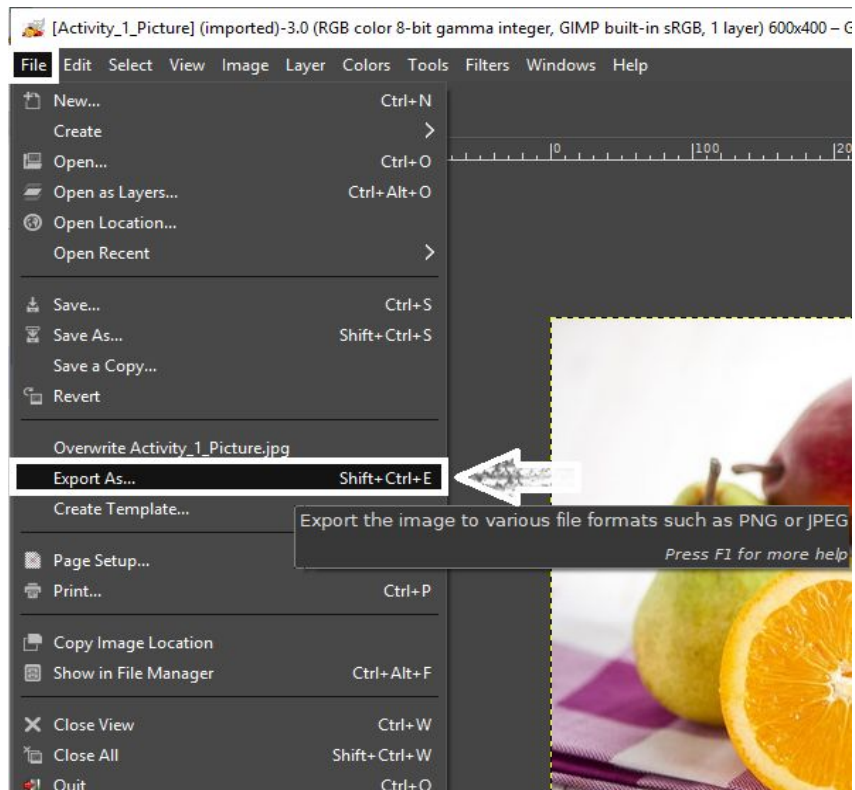

# Exporting Images

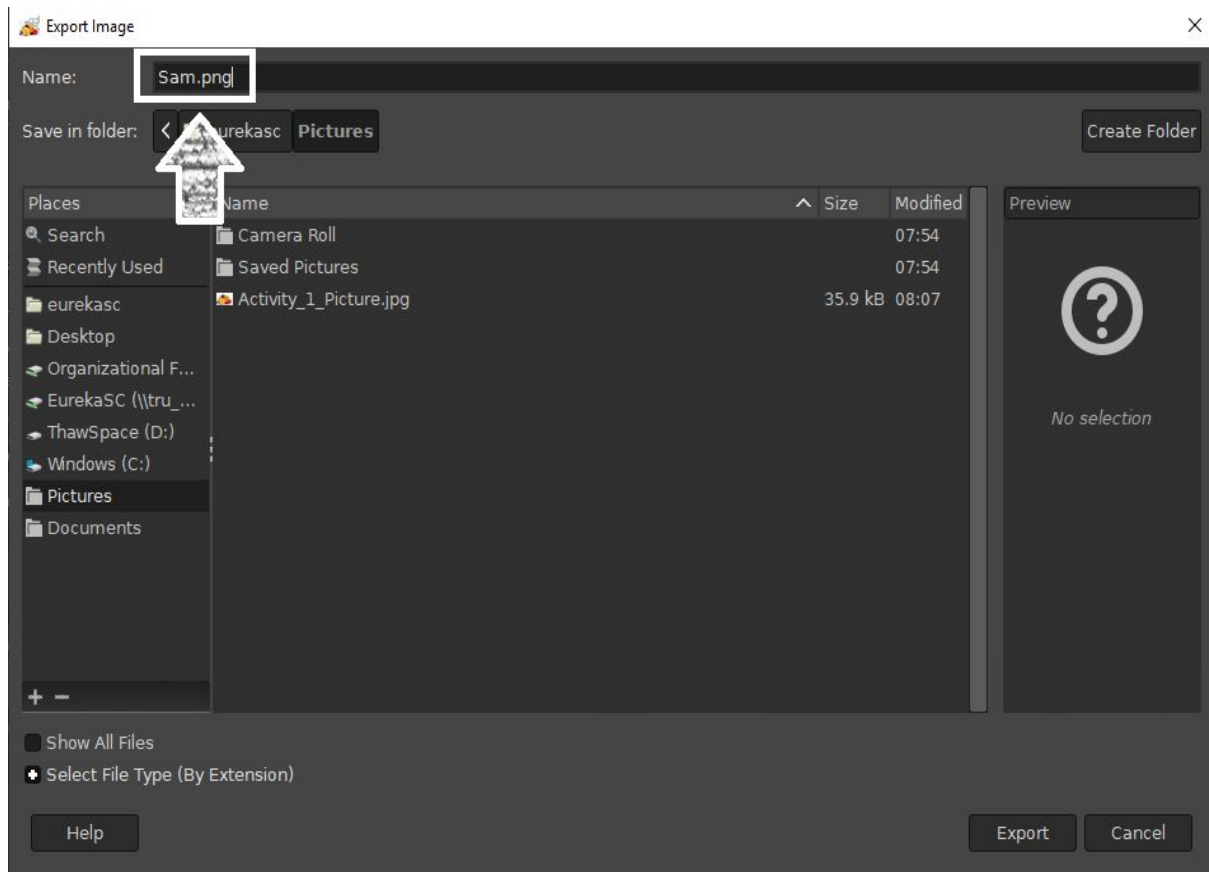

To export a file in GIMP, click “File”:

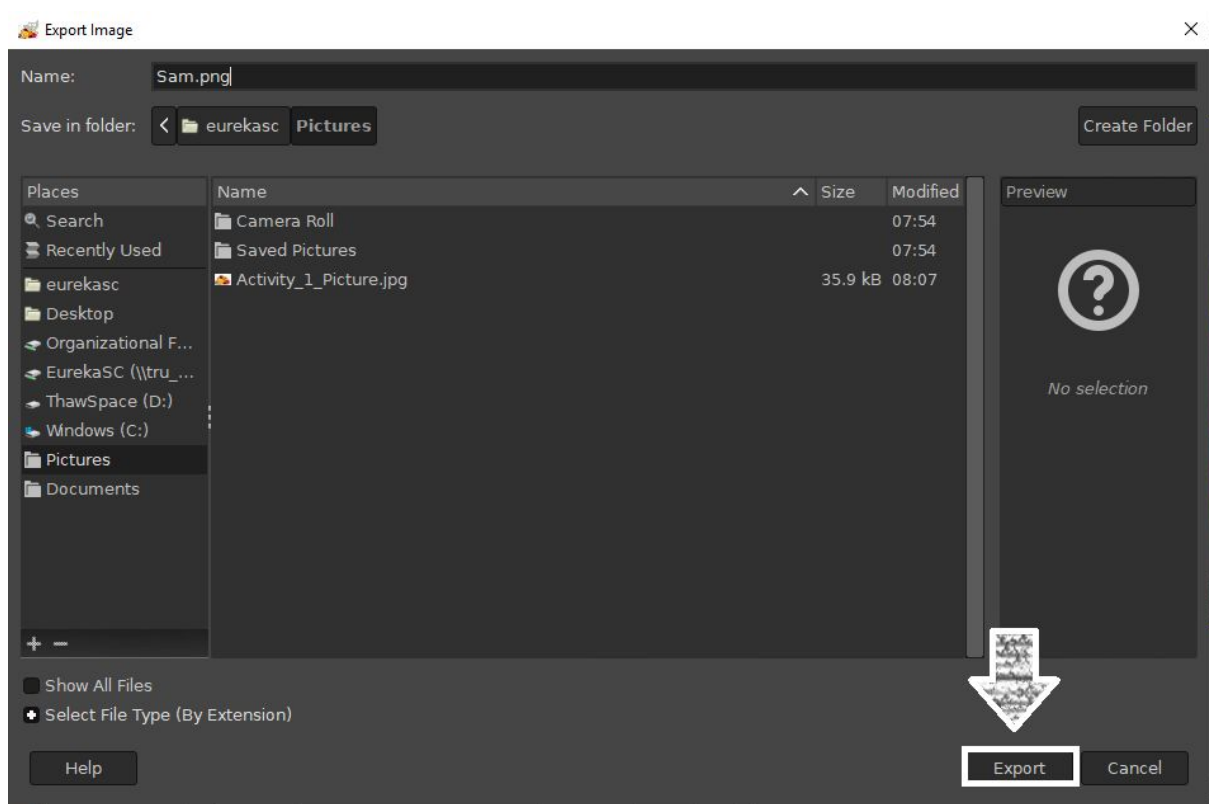

Then, click “Export As:”

In the new window that pops up, rename your file to something that suits it, and make sure the name ends with .png

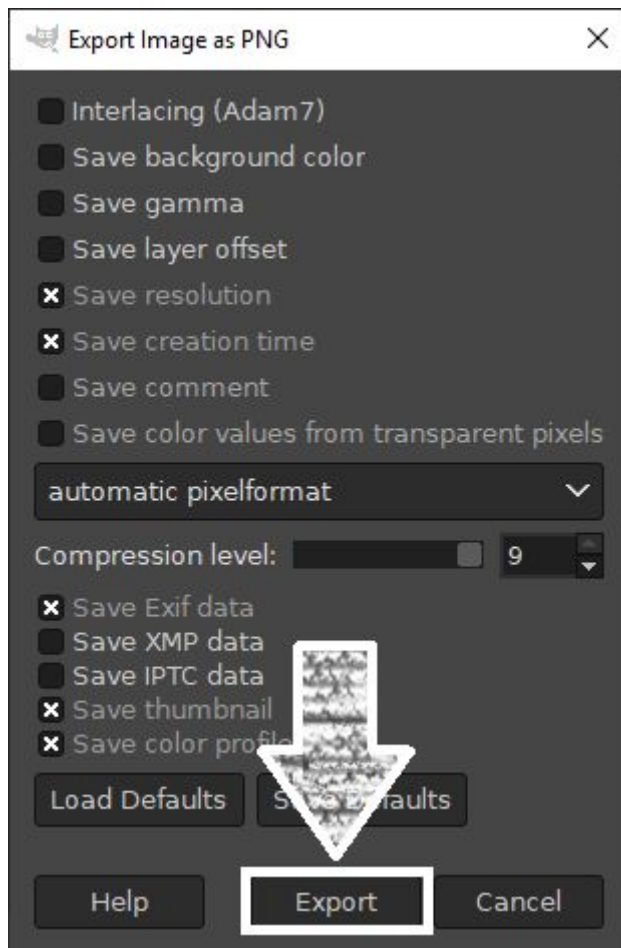

Click "Export".

Another window will open. Ignore the options and just click “Export”.

You have now exported your image!
